

BasketLens Analytics

See the basket. Understand the buyer.

Executive Insight Report | 2025 Grocery Shopping Trends

Purpose: translate the cleaned supermarket transaction ledger into practical inventory, merchandising, and promotion actions. This is a static business-intelligence report; forecasting and live integrations are out of scope.

Total sales	\$6,845.29
Transactions	316
Average basket value	\$21.66
Clean transaction lines	1,079

Data quality and method

The pipeline began with 1,093 raw records. It removed 14 redundant TransactionID/ProductID pairs, standardized mixed dates, repaired missing quantities with product-level median quantities, used product-master prices, recalculated TotalAmount as Quantity x UnitPrice, and restored customer attributes from the master dimension. The result contains no missing fact-table fields and is ready for Power BI ingestion.

Sales and Category Direction

Pantry is the leading category by sales, while Bakery is the lowest among the tracked categories. Apr is the highest-revenue month in the available 2025 ledger.

Category	Sales	Units
Pantry	\$1,455.80	484
Beverages	\$1,218.30	345
Frozen	\$803.40	210
Dairy	\$771.70	238
Household	\$692.00	141
Meat	\$651.40	101
Personal Care	\$386.90	119
Produce	\$329.79	278
Snacks	\$283.70	135
Bakery	\$252.30	102

Recommended actions

1. Protect availability in Pantry with higher reorder priority during peak demand windows. 2. Review Bakery assortment depth and use targeted bundles rather than broad discounting. 3. Use the dashboard’s customer-segment view to tailor offers by loyalty and region before allocating promotional budget.

Basket Affinity and Implementation

The most frequent observed product association is **Sugar + Tea Bags**, appearing in 22 multi-item baskets.

Item pair	Baskets
Sugar + Tea Bags	22
Coffee Beans + Sugar	18
Cola + Frozen Pizza	18
Cereal + Whole Milk	13
Butter + White Bread	11
Jam + Peanut Butter	11

Merchandising recommendations

Place high-frequency pairs in adjacent display zones or offer small bundle incentives. Treat pair counts as descriptive evidence, not causal proof; evaluate any promotion with a holdout period. In Power BI, relate Transactions to Products by ProductID, Customers by CustomerID, and Calendar by PurchaseDate/Date. Create measures for Total Sales, Transaction Count, and Average Basket Value from the cleaned ledger.

Prepared for BasketLens Analytics. All outputs use the approved Deep Blue, Fresh Green, Soft White, Dark Slate, and Warm Orange palette.
